

Infor ERP FACTS

Version 7.6 Data Sheet

Fully Graphical FACTS

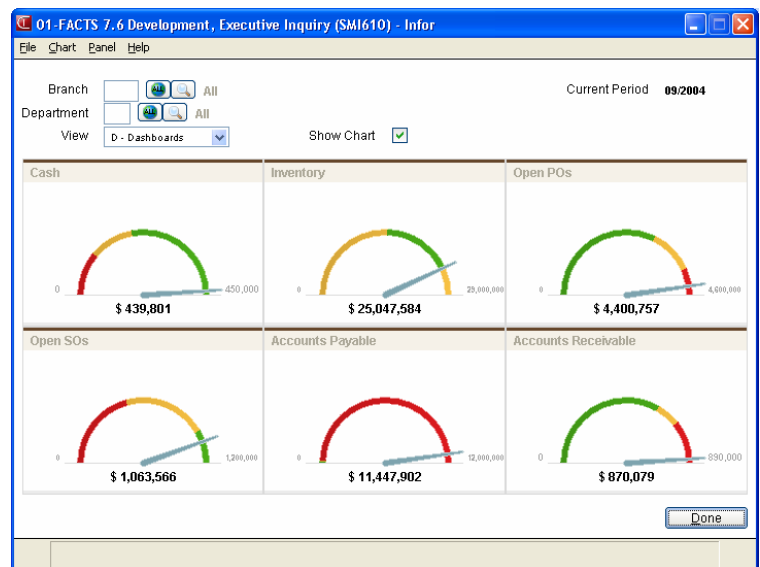

Boasting an attractive interface, newly-graphical programs aren't just another pretty face. With graphical conversion, programs gain the following advantages:

Efficiency

- More intuitive interface and navigation
- More drill downs for quicker access to information you're looking for
- Enhanced searching by access to more sorting orders and increased filtering options
- User preferences make you more efficient
- Access to new notes types
- Reports with Template access

Technology

- Easier and faster to port your modifications to the next release
- Field-level security through metadata
- Any graphical program can be accessed via the API Toolkit

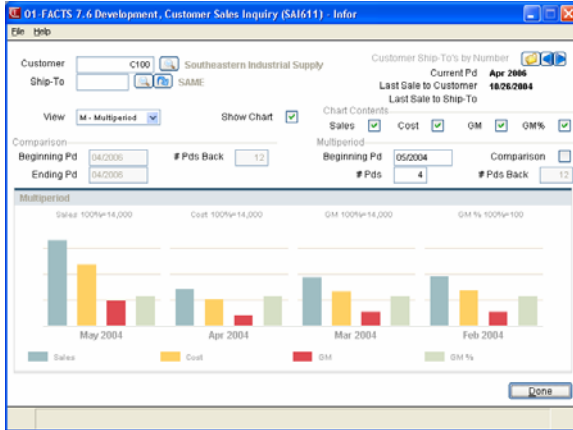

NEW FREIGHT TABLES

Enforce your freight policies by implementing the new freight tables, which are associated to customers with their default Ship Via settings. FACTS will use the freight table to recommend the correct freight charge on the quote or sales order.

New Executive Inquiry

- **Custom Dashboards:** What's important to you? Set up your own resizable dashboard to show only metrics that affect you.
- **View by Branch and Department:** Each panel you define can have its own department and branch specified.
- **Keep an eye on things all day:** Set each panel to be displayed until you close it. You can also set panels to auto-launch when you sign in.
- **Define things the way you see them:** Dashboard milestones (green, yellow, red) are defined by you.

Enhanced Sales Analysis

New Graphs: All inquiries display a fresh, easy-to-view graphical presentation.

Infinite Sales Analysis History: Keep as many months of Sales Analysis history you prefer.

No More "Not on File": Even if you delete an item, customer, or vendor from FACTS, Sales Analysis still retains them for historical purposes.

SQL Option: Customers who prefer Microsoft® SQL as a database platform can choose to run the Sales Analysis module on SQL for enhanced data mining capabilities.

Improved Passwords

Within the age of Sarbanes-Oxley, password security has become even more important than in the past. With new encryption and enforcement, distributors have full control over password administration. Administrators can specify:

- Minimum and maximum password length
- Required elements such as alpha characters, numeric characters, and special characters
- Days between required password reset
- Number of failed tries before password lockout

Order Review

Instead of printing out an order status report, simply use the Order Review program to glean the status of your backorders, the orders for a particular salesperson, orders on hold, and other order metrics.

API Toolkit

The API (Application Programming Interface) Toolkit provides a way to exchange information between FACTS and other computer systems via XML documents. Integrating the supply chain has never been easier with this flexible technology that leverages the new FACTS architecture to simplify data exchange.
